| PROJECT NAME | SMART FASHION RECOMMENDER APPLICATION |

The screenshot displays the Visual Studio Code interface with a Python file named `app.py` and a terminal window. The code in `app.py` is as follows:

```
1 from flask import Flask
2
3 app = Flask(__name__)
4
5 @app.route("/")
6 def hello_world():
7     return "<p>Hello, World!</p>"
8
9
10 if __name__ == "__main__":
11     app.run()
```

The terminal window shows the command `python app.py` being executed. The output indicates that the Flask application is running on `http://127.0.0.1:5000`. A warning message is displayed: "WARNING: This is a development server. Do not use it in a production deployment. Use a production WSGI server instead." The terminal also shows the command `pip` being used to install dependencies.

Below the terminal window, a web browser window is open at `127.0.0.1:5000`, displaying the output of the application: "Hello, World!"
